                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seq_name: /SIDS1/gcgdata/geneseq/geneseqp-emb1/AA1993.DAT:AAR39706
The DNA encoding a portion or (more preferably) the entire pp60 c-src polypeptide (Given in AAQ46688) is used to transform endothel cells. Transformed cells produce increased amounts of pp60 c-src an have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced mononuclear cell adhesion. They callso be used to improve the success of surgical procedures such as coronary angioplasty, heart bypass surgery, vessel graft and stent
                                                                                                                                                                                                                                                                                                               Genetically engineered endothelial cells - which exhibit enhanced cell migration, urokinase-type plasminogen activator activity, and reduced mononuclear cell adhesion and fibronectin prodn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human pp60 c-src protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the wild-type chicken c-Src tyrosine kinase. This Src protein can be used to modulate angiogenesis. When the Src protein is inactivated, angiogenesis is inhibited while, when it is activated, angiogenesis is potentiated. The modified or variant Src be used to treat inflammatory diseases like, arthritis, rheumatoid arthritis, diabetic retinopathy, restenosis, osteoporosis and cancer

                                                                                                The present sequence is the mutant chicken c-Src tyrosine kinase, SrcA. This sequence has a point mutation, Y52FF, to activate c-Src. This site is involved in negative regulation by the kinase CSK. Phosphorylation of Tyr residue at 527 inactivates the protein. But in the mutated SrcA, the regulatory Tyr is replaced with Phe, thus constitutively activating the protein. This mutant Src protein can be used to modulate angiogenesis. When the Src protein is inactivated, angiogenesis is inhibited while, when it is activated, angiogenesis is inhibited while, when it is activated, angiogenesis like, arthritis, rheumatoid arthritis, diabetic retinopathy, restenosis, osteoporosis and cancer associated disorders.

Note: This sequence is not found in the specification, but derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chicken; mutant Src; SrcA; point mutation; Y527F; phosphorylation; negative regulation; tyrosine; inflammatory disease; osteoporosis; rheumatoid arthritis; diabetic retinopathy; restenosis; cancer.

                                                                                                                                                                                                                                                                                                                                                                                     The DNA encoding a portion or (more preferably) the entire pp60 c-src polypeptide (Given in AAQ46687) is used to transform endothelial cells. Transformed cells produce increased amounts of pp60 c-src and have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced mononuclear cell adhesion. They can also be used to improve the success of surgical procedures such as coronary angioplasty, heart bypass surgery, vessel graft and stent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genetically engineered endothelial cells - which exhibit enhanced cell migration, urokinase-type plasminogen activator activity, and reduced mononuclear cell adhesion and fibronectin prodn

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1601 AGAACCTC 1608

CC polynuclectides are also used in diagnostics as expressed sequence tags (for identifying expressed genes. (I) is useful in gene therapy techniques (C for identifying expressed genes. (I) a useful in gene therapy techniques (II) is useful for generating antibodies against it, detecting or committating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II), (I) and (II) are useful for treating (C imaging of sites expressing (II), (I) and (II) are useful for treating (C inspin) the polypeptide and polynucleotide sequences have applications in (id) and (iv) are useful for treating (II), (I) and (II) are useful for treating (I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           409
                                                                                                                                                                                                                                                                                                                                                             crystal
```

The present invention relates to a crystal of a protein-ligand complex comprising a truncated lymphocyte kinase (lck) and a ligand. The crystal diffracts X-rays so that the atomic coordinates of the protein-ligand complex can be determined to a resolution of greater than 5.0 Angstroms. The truncated lck used in the present invention comprises the globular core of the corresponding full-length lck. The present sequence is the full-length human lck protein. The crystal of the present invention may be used to identify kinase inhibitors in screening assays, in drug screening and drug design processes, to design, select or test inhibitors of kinase enzymes, where the inhibitors are used as therapeutics for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC The invention provides a novel method of altering the activity of the CC protein kinase A (PKA) signaling pathway in a cell that comprises CC altering the extent of phosphorylation of one or more PKA substrates, or CC kinase substrates downstream in the PKA signaling pathway. Pharmaceutical CC compositions containing a nucleic acid molecule that encodes a PKA CC substrate, or fragment, precursor or functionally equivalent variant, CC where the sequence is modified to alter its susceptibility to CC phosphorylation by PKA can be used for treating a disorder exhibiting CC abnormal PKA signaling activity, immunosuppressive disorders or CC proliferative diseases. They can be used for treating e.g. HIV CC infection, AIDS, common variable immunodeficiency or cancers. Conditions CC in which upregulation of the PKA pathway is required, such as autoimmune CC disease, e.g. systemic lupus erythematosus, may also be treated. The CC present sequence represents a PKA substrate, wherein the substrate is in CC the Src-family, preferably Lck, Fyn, Src, Yes, Fgr, Lyn, Hck Blk, Yrk, CC c-tkl, Fyk, Src-l or Src-2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1401
The specification describes a method for modulating vascular permeability in a tissue suffering from a disease condition. The method comprises contacting the tissue with a pharmaceutical composition comprising tyrosine kinase protein Src, Yes or their mixtures or nucleic acid expressing them. The method is useful for modulating vascular permeability in tissues, including inflamed tissue, tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular permeability; tyrosine kinase protein; Src; Yes; stroke; myocardial infarction; restenosis; trauma; blood vessel; atherosc; diabetic retinopathy; inflammatory disease; infection; arthritis; adult respiratory distress syndrome; ARDS; rheumatoid arthritis; diabetic retinopathy; psoriasis; neovascular glaucoma; capillary proliferation; osteoporosis; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       514

Pathologies which may be treated include include trauma to blood vessels, and other systemic pathological events such as atherosclerosis, diabetic retinopathy, inflammatory disease due to infection by microbial agents and arthritis. Other diseases which can be treated include adult respiratory distress syndrome (ARDS), rheumatoid arthritis, diabetic retinopathy, psoriasis, neovascular glaucoma, capillary proliferation in atherosclerotic plaques and osteoporosis and cancer associated disorders such as solid tumours, solid tumour metastases, angiofibromas and hemangiomas. The present sequence represents chicken Src, and is used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the mutant chicken c-Src tyrosine kinase, Src(K295M). This sequence has a point mutation, K295M, in the kinase domain, which prevents ATP binding and also blocks kinase dependent Src functions related to vascular cell and tumour cell signalling and proliferation. This mutant Src(K295M) protein, can be used to modulate specifically, inhibit angiogenesis. When the Src protein is inactivated, angiogenesis is inhibited while, when it is activated, angiogenesis is potentiated. The mutant or variant Src can be used to treat inflammatory diseases like, arthritis, rheumatoid arthritis, diabetic retinopathy, restenosis, osteoporosis and cancer associated disorders. Note: This sequence is not found in the specification, but derived from the sequence in Fig 2.

                                                                                                                                                                  Align seg 1/1 to:
                                                                                                                                                                                                                                                    Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                  to human tyrosine kinase Hck. Also described are: (1) nucleic acids encoding the protein and its derivatives; (2) recombinant vectors containing the nucleic acids; and (3) host cells transformed by the vectors and expressing the protein. HSB-1 has cytostatic activity, binds tyrosine kinase, enhances tumour necrosis factor alpha and promotes apoptosis. HSB-1 proteins are used for the elucidation of the mechanism of Hck signal transduction and of the role of Hck in human immunodeficiency virus (HIV) infection. They can be used for the treatment of infections and other diseases with which Hck is associated. They promote the anticancer activity of tumour necrosis factor alpha. The present sequence represents the human tyrosine kinase Hck protein, which is used in an example from the present invention.
